focal peripheral neuropathies. Focal peripheral neuropathies are not at the fashionable end of the neurological street. However they are important, as they are very common, sometimes disabling, and often treatable. They can also be a source of confusion when they occur in patients with other neurological diseases.

FOCAL PERIPHERAL NEUROPATHIES | Journal of Neurology ...

Focal neuropathies are conditions in which you typically have damage to single nerves, most often in your hand, head, torso, or leg. This type of nerve damage is less common than peripheral or autonomic neuropathy. Many different focal neuropathies can affect people who have diabetes. Entrapments. Entrapments, or entrapment syndromes, are the most common type of focal neuropathy.

Focal Neuropathies | NIDDK

Focal neuropathy is one of four neuropathies that typically only affect diabetic patients, with the other three being peripheral, autonomic, and proximal neuropathy. Focal neuropathy is found most often in older patients with diabetes and can be caused by excess body weight and unmaintained blood sugar .

What is Focal Neuropathy? (with pictures)

Imaging is particularly valuable in complex cases with discrepant nerve function test results. Familiarity with the clinical features of various peripheral neuropathies of the upper extremity, the relevant anatomy, and the most common sites and causes of nerve entrapment assists in diagnosis and treatment.

Multimodality Imaging of Peripheral Neuropathies of the ...

If imaging of peripheral nerves is indicated, ultrasound is the preferred modality for superficial peripheral nerves. MRI may be used for imaging deep nerves such as the lumbosacral plexus or nerves obscured by overlying bone such as the brachial plexus or for surgical planning. CT is limited to cases in which MRI is contraindicated.

Detection of common peroneal entrapment neuropathy with MR imaging can be rewarding (19, 27, 33, 34). The proximal portion of the CPN at the knee level is large enough that increased signal intensity within it can be easily appreciated on axial fluid-sensitive images. Increased size of the nerve is a common associated finding.

neuropathy. Magnetic resonance imaging and ultrasound can be used in peripheral nerve imaging to demonstrate extrinsic compressive lesions, focal neural lesions such as neural edema and swelling, focal neural scarring (posttraumatic neuroma in continuity) and intraneural ganglia. Imaging can also demonstrate the effects

Imaging of peripheral nerve lesions in the lower limb.

Abstract Over the last decade, neuromuscular ultrasonography has emerged as a useful tool for the diagnosis of peripheral nerve disorders. This article reviews sonographic findings of normal nerves, including key quantitative ultrasound measurements that are helpful in the evaluation of focal and possibly generalized peripheral neuropathies.

Ultrasonography of peripheral nerves

Developing skills for imaging peripheral nerves can be used for proper tissue recognition in musculoskeletal evaluations, diagnostic assessment of both focal and generalized neuropathies, and in identification for nerve blocks.
