'G is for Genes' is a book that describes the importance of genotyping in the coming generations as the basis for education's individualization. This is evident by early-stage identification of the innate aptitude of the child, and by establishing standardized but flexible behaviors adapted to the individual needs to ultimately promote suitable stimuli for altering environmental factors.

A always goes with T, and C always goes with G. The order of these individual strands is basically a code for your genetic programming. About 3% of DNA is in the form of individual genes (20,000 to 25,000 of 'em!). These genes are specific sequences that code individual proteins.

Usage of the term "having a gene" (e.g., "good genes," "hair colour gene") typically refers to containing a different allele of the same, shared gene. Genes evolve due to natural selection / survival of the fittest and genetic drift of the alleles. The concept of gene continues to be refined as new phenomena are discovered.

Gene - Wikipedia

The GNAS gene provides instructions for making one component, the stimulatory alpha subunit, of a protein complex called a guanine nucleotide-binding protein (G protein). Each G protein is composed of three proteins called the alpha, beta, and gamma subunits.

This classification applies to gene mutations as well. If you only need to inherit one copy of a gene mutation to get a disease or syndrome, it is called dominant. If you need 2, it is called recessive. (Gene mutations are discussed in the next section.) X-linked genes. Things are a little different in terms of genes on the X chromosome.

Genes on the X chromosome are referred to as sex-linked, or X-linked, genes. Normally, in the nonsex chromosomes, the genes on both of the pairs of chromosomes are capable of being fully expressed. However, in females, most of the genes on one of the two X chromosomes are turned off through a process called X inactivation (except in the eggs in ...
