## List of accelerators in particle physics - Wikipedia

A particle accelerator is a machine that uses electromagnetic fields to propel charged particles to very high speeds and energies, and to contain them in well-defined beams. Large accelerators are used for basic research in particle physics. The largest accelerator currently operating is the Large Hadron Collider near Geneva, Switzerland, operated by the CERN. It is a collider accelerator, which can accelerate two beams of protons to an energy of 6.5 TeV and cause them to collide head-on, creati

Accelerators and colliders can be broadly classified into linear and circular (or nearly circular) machines. With classical electrostatic accelerators and proton or electron radio-frequency linear accelerators, the scaling laws imply that the costs and other resources required should grow about linearly with energy.
