### Integers And Integer

Integers. An integer is simply a positive or negative whole

number. These are all examples of integers:

$-12, -1, 0, 1, 2, 5, 99, 100$   
 $000 - 12, -1, 0, 1, 2,$   
 $5, 99, 100000.$  These

are not integers:

$-3.7, -1\frac{2}{3}$   
 $4, 1.2, 106.7 - 3.7, -1$   
 $2, 3\frac{4}{5}, 1.2, 106.7.$

When you add,  
subtract or multiply

two integers you get  
another integer.  $-3 \cdot 11$   
 $= -33 - 3 \cdot 11 = -33.$

Integers are whole numbers that are represented by tick marks on a number line. In between these marks, there are large spaces that are described as decimals and fractions. A fraction is a way to divide a section between integers into equally-spaced segments. A decimal representation divides

Integers are negative numbers, zero and positive numbers.

Adding and subtracting integers are useful in everyday life because there are many situations that involved negative numbers such as calculating sea level or temperatures.

Equations with integers are solved using inverse operations.
