Trauma, PTSD, and Memory Distortion | Psychology Today

Memory is described by psychology as the ability of an organism to store, retain, and subsequently retrieve information. When an individual experiences a traumatic event, whether physical or psychological, their memory can be affected in many ways. For example, trauma might affect their memory for that event, memory of previous or subsequent events, or thoughts in general.

Memory and trauma - Wikipedia

Trauma can have a profound impact on a person's memory and traumatic memory can affect not only the brain, but also the body and nervous system as well. But conceptualizing how trauma can impact the different types of memory can be challenging, so we created a free tool for practitioners that breaks down this process.
